Background

Phosphatidylinositol-4-phosphate-5-kinase (PIP5K) synthesizes phosphatidylinositol-4,5-bisphosphate, which regulates various processes including cell proliferation, survival, membrane trafficking, and cytoskeletal organization. The PIP5K family is divided into type I, type II and type III. Each type of the PIP5K family phosphorylate distinct substrates and they contain an activation loop, which determines their enzymatic specificity and subcellular targeting. The phosphatidylinositol-4-phosphate-5-kinase type I consists of three members, PIP5K I α , I β , and I γ , which are characterized by phosphorylating PI4P on the 5-hydroxyl. PIP5K I α (designated PIP5K I β in mouse) is expressed in brain tissue. PIP5K I β , designated PIP5K I α in mouse, is also called STM7. PIP5K I γ has two variants produced by alternative splicing which are expressed in lung, brain, and kidneys.
